RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 20 pages. OCLC Number: (OCoLC)182762752 Subject: Trout fisheries -- Coeur d'Alene Tribe of the Coeur d'Alene Reservation, Idaho. Excerpt: . . . ISRP Review of Coeur d'Alene Tribe Trout Production Facility Master Plan Response to question 1. Work conducted by the Coeur d'Alene Tribe Fish, Water and Wildlife Program has helped determine that habitat components utilized in each of the three critical life history phases, as well as interactions with introduced species, potentially limit production of adfluvial fishes. These components include spawning habitat and juvenile rearing habitat in tributary streams, and adult rearing habitat in the lake. In order to effectively increase populations of westslope cutthroat trout, habitat restoration must take place in natal streams. However, restoration of the critical tributary habitat does not guarantee increases in adfluvial trout production because adfluvial westslope cutthroat trout reside in Coeur d'Alene Lake for two-thirds of their life cycle. Evidence suggests that production of cutthroat trout is indirectly limited by lake habitat features, but the extent of this limitation is not fully understood. We feel that our best shot at increasing productivity in the short term (5-20 years) is to focus our restoration efforts on the streams. Given the geomorphology of Coeur d'Alene Lake any physical manipulations (restoration opportunities) available to us are long term projects (25-50 years to produce an effect). Diking the southern end is not feasible economically. Results would not justify the expense. Natural levees protect the migration corridors in the St. Joe and Coeur d'Alene Rivers. Some protection from degradation of these natural levees should be afforded in the near future. This is something that the Tribe is currently working on. Response to question 2: Regulation of the lake level by...
